C Programming Language

DECEMBER 5, 2014

Today's task

- Basic C Features
 - Basic types
 - Basic programming structure
 - Sequence
 - Branch
 - Loop
- Array
- C-style string

Basic types

int

float

double

char

int a = 1

4 Bytes

float pi = 3.14f

4 Bytes

double pi = 3.14159

8 Bytes

char c = 'h'

1 Bytes

Type convert

- Accuracy
 - double > float > int

- int and char convert
 - Ascii table

<u>Dec</u>	Нх	Oct	Char		Dec	Нх	Oct	Html	Chr	Dec	Нх	Oct	Html	Chr	Dec	: H×	Oct	Html Cl	<u>hr</u>

Three Basic program structure

- sequence
- branch
- loop

```
int a = 1;
int b = 2;
int c = a + b;
```

Branch if...else

```
int a=1;
if(a>0)
    printf("positive");
else if(a < 0)
    printf("negative")
else
    printf("Zero")
```

```
int i=1;
   if(a>0)
                   printf("positive ");
     else
                   printf("negative ");
   if(a<0)
printf("zero")
```

Loop

- Perform a set of repetitive task until text expression becomes false
 - while
 - do...while
 - for

• calculate 1+2+3+...+100

Loop while

```
int i = 0;
int sum = 0;
while(i<=100)
{
    sum += i;
    i += 1
}</pre>
```

Loop do while

```
int i = 0;
int sum = 0;
do
{
    sum += i;
    i += 1;
} while (i<=100);</pre>
```

Loop for

```
for (int i=0;i<=100;i++)
{
    sum += i;
}</pre>
```

When should we use while, do while and for?

- most loops can be written in all three ways
- while
 - check the expression first and do jobs
- do...while:
 - do jobs first and then check the expression
- for
 - if you know the loop times exactly, use for
 - code is short

Break and continue

Break: stop the loop

Continue: only skip this time

```
do {
while (test expression) {
                                           statement/s
                                           if (test expression) {
   statement/s
   if (test expression) {
                                               break;
       break;
                                           statement/s
   statement/s
                                        while (test expression);
```

```
for (intial expression; test expression; update expression) {
    statement/s
    if (test expression) {
        break;
    }
    statements/
}
```

```
while (test expression) {
    statement/s
    if (test expression) {
        continue;
    }
    statement/s
}
```

```
do {
    statement/s
    if (test expression) {
        continue;
    }
    statement/s
    }
    while (test expression);
```

```
for (intial expression; test expression; update expression) {
    statement/s
    if (test expression) {
        continue;
    }
    statements/
}
```

function

Code that we need to use more than once

```
int mul(int x, int y)
{
   return x * y;
}
```

Pass parameter by value or by address

```
int self_add1(int x)
{
    x = x + 1;
    return x;
}
```

```
int self_add2(int *x)
{
    *x = *x + 1;
    return *x;
}
```

```
printf("%d\t%d",self_add1(x),x);
printf("%d\t%d",self_add2(&x),x);
```

A little challenge

- Write a little program that users can type an expression and the program will return the result
- e.g.
 - if users type 1 + 2 and press enter
 - the program will display 3 on the screen
